The first part of the paper is devoted to a discussion of the
 general principles of the theory of the structure of the
 crystal lattice. It is shown that the structure of the
 crystal lattice is determined by the balance of the
 forces of attraction and repulsion between the atoms.
 The forces of attraction are due to the electrostatic
 interaction between the positive and negative ions,
 while the forces of repulsion are due to the overlap
 of the electron shells of the atoms. The balance of
 these forces determines the equilibrium distance
 between the atoms, which is the lattice constant.
 The lattice constant is a function of the temperature
 and the pressure. At high temperatures, the thermal
 expansion of the crystal leads to an increase in the
 lattice constant. At high pressures, the compression
 of the crystal leads to a decrease in the lattice
 constant. The change in the lattice constant with
 temperature and pressure is a measure of the
 compressibility of the crystal.

The second part of the paper is devoted to a
 discussion of the properties of the crystal lattice.
 It is shown that the properties of the crystal
 lattice are determined by the structure of the
 crystal lattice. The properties of the crystal
 lattice include the density, the refractive index, the
 thermal conductivity, the electrical conductivity,
 the magnetic susceptibility, and the piezoelectric
 coefficient. The properties of the crystal lattice
 are functions of the temperature and the pressure.
 The change in the properties of the crystal
 lattice with temperature and pressure is a
 measure of the anisotropy of the crystal.
